

Angular Task

- Create a data table with dummy data
- A dummy data model is like
 - name
 - creation_date
 - type : 1. User , 2. Admin
- Data table should have pagination feature with maximum 10 data per page
- Add 3 filters : 1. Date-range filter , 2. Search filter , 3. Type filter
 - User should be able to select date range and filter
 - User should be able to search using name
 - User should be able to filter User and Admin type
- You can add sorting in the creation_date column but not necessarily.
- The consequences of changing events for Pagination, filters & sorting should be logically correct.
- Please create one repository on github named lenditt_interview_task, Push your code.
- Note :- All the UI should have a good design, responsive & user experience of your choice. You are recommended to use Angular Material but not must.
